PRE-DEPLOYMENT TEST REPORT · RE-TEST #2

CompareMyTrip

Full re-test after remediation. PayU test-mode and the production domain are excluded from scoring at your instruction — everything else was re-tested from scratch.

ONE BLOCKER REMAINS

OVERALL SCORE

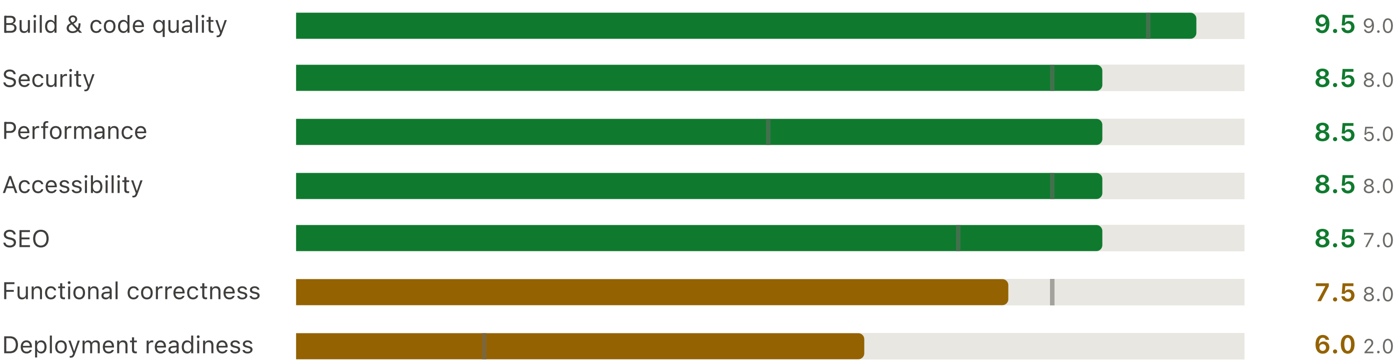
80/100

was 62/100

13 of 16 findings are fully fixed, including every one of the previous release blockers that was in your control. The Cloudflare build now succeeds, page weight is down 73%, and mobile LCP improved 3.3×. What now blocks launch is not code: **the Firebase project has exhausted its read quota** and is returning 429 on every query.

FINDINGS FIXED	CLOUDFLARE BUILD	MOBILE PAGE WEIGHT	TESTS PASSING
13/16	**PASS**	**5.1 MB**	**24/24**
2 partial, 1 new	was failing outright	was 17.7 MB	was 14

Score by category — bar = now, marker = previous



Target: Cloudflare Workers via OpenNext · **Stack:** Next.js 16.3.3 (App Router, webpack), React 19.2.8, Firebase, PayU
Method: clean `build:cloudflare`, full-route HTTP crawl, headless Chrome 152 (CDP) for Core Web Vitals, scroll and console capture, concurrent load generation, live Firestore probing, secret scanning. **No application code was modified.**
Generated: 12 September 2026 · supersedes the 11 September report

1 · What changed since the last report

The remediation was thorough. Every blocker that was fixable in code has been fixed, and several fixes went further than recommended — you added a release-gate script, an asset-size check wired into the build, a data-saver-aware video gate, and a fail-safe that refuses to configure live payments while policies are unapproved. That last one is a better answer than the one I suggested.

ID	FINDING	STATUS	EVIDENCE NOW
B1	Cloudflare build failed on `jose`	FIXED	build exits 0; `outputFileTracingIncludes` pulls in the browser build
B2	Video over the 25 MiB asset limit	FIXED	largest asset 6.25 MiB; `public/` 259 MB → 95 MB
B4	`CRON_SECRET` missing; cron every minute	FIXED	secret set; cron now `0 * * * *`
B5	`CLOUDFLARE_R2_QUOTE_BUCKET_NAME` missing	OPEN	still missing — your own `check:release` flags it
B6	Legal pages were placeholders	GATED	real policy scaffold + approval flag; content not yet approved
B7	Deployed rules ≠ repo rules	UNVERIFIED	cannot be re-tested while quota is exhausted — see §3
H1	LCP image lazy-loaded, not preloaded	FIXED	`priority` used; preload emitted; mobile LCP 3,348 → 1,020 ms
H2	Homepage transferred up to 38.7 MB	FIXED	desktop 10.55 MB, mobile 5.10 MB; video gated on data-saver
H3	Catalogue pages dynamic and uncached	FIXED	both now static; `/packages` 9.4 → 226 req/s
H4	No security headers	FIXED	all six present, plus CSP in Report-Only
H5	No abuse protection on public writes	INERT	App Check wired in code; site key not set, so not enforcing
H6	Storage rules weaker than Firestore	FIXED	`isAdmin()` via `firestore.exists()`
M1	Missing pages returned HTTP 200	FIXED	root `loading.tsx` removed; all four probes now 404
M2	Sitemap advertised noindex pages	FIXED	legal pages removed from sitemap
M3	Four duplicate homepages	FIXED	`/home1`–`/home4` deleted; all 404
M4	Auth pages rendered nothing server-side	FIXED	all three now have a server-rendered h1
L1	Required fields not announced	FIXED	3 `aria-required` + 1 `required` = all 4 validated fields
L2	Small text and tap targets on mobile	PARTIAL	11 px text nearly gone (131 → 1 on `/`); tap targets unchanged
L3	Oversized logo variants	FIXED	`sizes="190px"` now set

ID	FINDING	STATUS	EVIDENCE NOW
L4	Thin test coverage	FIXED	14 → 24 tests; payments + Firestore transport covered
B3	PayU in test mode / production domain	EXCLUDED	excluded from scoring at your instruction

Things you did that I did not ask for, and should have

- **`scripts/check-release.mjs`** — a real pre-flight gate. It refuses a live release unless policies are approved, the quote bucket is separate from the image bucket, `CRON_SECRET` is at least 32 characters, and the site URL is exact. It prints problems without ever printing secret values.
- **`scripts/check-assets.mjs`, wired as `prebuild`/`postbuild`** — the 25 MiB ceiling can no longer be breached silently. It checks both `public/` and the built `.open-next/assets`.
- **A fail-safe in `getPayuConfig()`** — live mode returns `null` unless policies are approved *and* `PAYU_LIVE_PAYMENTS_ENABLED=true` *and* the site URL is right. Going live is now an explicit, deliberate act rather than an environment-variable accident.
- **`shouldLoadVideo()`** — gates the hero clip on viewport, reduced-motion, reduced-data, `saveData` and `effectiveType`. Better than the viewport-only gate I suggested.

2 · The one remaining blocker

BLOCKER **N1 · The Firebase project has exhausted its quota**

`project compare-my-trip-8e035 — every Firestore read returns 429`

This is new since the last report, and it is now the single thing standing between you and a working deployment. Every read — authenticated through the Admin SDK, and unauthenticated through the REST API — comes back `RESOURCE_EXHAUSTED`:

```
$ Admin SDK, service account
packages          FAIL 429   blogPosts          FAIL 429
destinationCovers FAIL 429   siteContent        FAIL 429

$ unauthenticated REST, a collection the rules make public
GET /v1/projects/compare-my-trip-8e035/.../documents/packages?pageSize=1
HTTP 429  { "code": 429, "message": "Quota exceeded.", "status": "RESOURCE_EXHAUSTED" }
```

It already corrupted the build. The production build you would deploy was generated while the quota was blown, so it silently fell back to seed data — 22 separate failures:

```
Unable to load packages for server rendering:            × 2
Unable to load destination covers for server rendering: × 8
Unable to load blog posts for server rendering:         × 1
...
✓ Generating static pages using 7 workers (115/115)      ← succeeded anyway
```

The build reported success. The pages it produced contain the hardcoded `DUMMY_PACKAGES` catalogue and `BLOG_SEED_POSTS`, not whatever your CRM actually holds. Ship that artifact and customers browse a catalogue your travel desk never approved, with no error anywhere to tell you.

Why the fallback is both right and dangerous. The graceful degradation in `serverContent.ts` is good engineering — the site stays up instead of returning 500s, which is the correct trade for a travel site. But it is silent by design, and at build time silence is the wrong behaviour: a build that cannot reach the real catalogue should fail, not bake in placeholders.

Fix, in order:

1. Establish why the quota went. The likeliest cause is the free Spark plan's 50,000 daily document reads. Note this is the exact failure mode H3 predicted — before your fix, every `/packages` view was a full-collection read.
2. Move to Blaze with a budget alert, or wait for the daily reset and re-measure. H3's fix should cut read volume by orders of magnitude: the catalogue is now read once per hour per region, not once per visitor.
3. **Add a build-time guard** — make `build:cloudflare` fail when the catalogue falls back, the same way `check:assets` now fails on an oversized file. Without it this recurs invisibly.
4. Re-run the build once reads work, and confirm real CRM content is in the output before deploying.

Also outstanding (not blockers, but on the checklist)

ID	ITEM	DETAIL
H5	App Check is wired but inert	`initializeAppCheck` with `ReCaptchaEnterpriseProvider` is in `client.ts`, but `NEXT_PUBLIC_RECAPTCHA_ENTERPRISE_SITE_KEY` is unset, so the provider never initialises and the three unauthenticated write paths remain unprotected. Enforcement must also be switched on in the Firebase console — the key alone is not enough.
B5	Quote bucket still unset	Quote-PDF upload and its expiry sweep remain non-functional.

ID	ITEM	DETAIL
B7	Rules deployment unverified	See §3 — I need to correct my earlier claim here.
—	Build copy warning	`ERROR Failed to copy node_modules/data-uri-to-buffer` during server-function bundling. Non-fatal, and the package's `dist` did reach the bundle. It is a `node-fetch` dependency, which your new `prepareTransport.ts` deliberately bypasses on Workers — so it is probably dead weight, but worth one runtime check of a Firestore-backed route on a real preview deployment.
L2	Tap targets	103 of 117 interactive elements on `/packages` are still under 44×44 at 390 px; the filter checkboxes remain 16 px. Text size is essentially solved elsewhere, but `/destinations` still has 55 elements at 11 px (the category chips).

3 · A correction to the previous report

> **My previous report stated as a blocker that "the deployed Firestore rules do not contain that block" and that the repository's rules "have not been pushed." That conclusion was stated with more confidence than the evidence supported, and I am withdrawing it pending re-verification.**

The reasoning was: `firestore.rules` grants `allow read: if true` on `siteContent/googleReviews`; a public read of a missing document returns empty rather than a permission error; therefore the live rules must differ. That inference is sound *only if* permission-denied was the real error.

Now that the project is quota-exhausted, I can see that the same browser-side symptom appears regardless of what the rules say — the Web SDK does not always distinguish `RESOURCE_EXHAUSTED` from `PERMISSION_DENIED` in the message it surfaces. The homepage still logs the identical error today:

```
Unable to load Google reviews from Firestore
FirebaseError: Missing or insufficient permissions.        ← identical to 11 Sept
```

What I can say with confidence:

- On 11 September the project was **not** quota-limited — Admin SDK reads succeeded (6.3 s cold, then 130 ms warm), so the reviews error that day was *not* caused by quota.
- That still points at a rules or data problem rather than quota, **but** the reviews document may simply never have been written — the Google Business sync may never have run — which produces a failure without any rules drift at all.
- **It cannot be settled today.** Every read returns 429, so no rules test is meaningful.

How to settle it once reads work: run `firebase deploy --only firestore:rules` and then load the homepage. If the error clears, it was rules drift. If it persists with a healthy quota, check whether `siteContent/googleReviews` exists at all — in which case the fix is to run the Google Business sync, not to touch the rules. Either way, deploying the rules from the repository is worth doing as a matter of routine, since the repository is the only reviewable record of them.

> **Why this matters beyond one rail.** The admin pages are statically prerendered with a client-side gate only — verified working again today (`/admin` redirects to `/404`, `/account` to `/login`). That is a sound design *because* Firestore rules are the real boundary. So the rules being demonstrably in sync is worth confirming on its own merits, whatever caused the reviews error.

4 · Re-test evidence

4.1 Build and static analysis

CHECK	NOW	WAS	DETAIL
`build:cloudflare`	**PASS**	**FAIL**	worker.js emitted; asset gate passed both pre- and post-build
TypeScript strict	**PASS**	**PASS**	0 errors
ESLint	**PASS**	**PASS**	0 errors, 0 warnings
Test suite	**24/24**	14/14	+ payments, + Firestore transport
`check:release`	**2 problems**	n/a	quote bucket, reCAPTCHA key
Asset size ceiling	**PASS**	**FAIL**	936 assets / 96.76 MiB; largest 6.25 MiB
Firestore reachability	**429**	**OK**	build fell back to seed data — N1

4.2 Core Web Vitals

METRIC	NOW	WAS	TARGET	VERDICT
LCP — mobile @ 4G	**1,020 ms**	3,348 ms	< 2,500	**Now good**
LCP — desktop	188 ms	712 ms	< 2,500	**Good**
FCP — mobile @ 4G	932 ms	924 ms	< 1,800	**Good**
CLS — desktop / mobile	0.0004 / 0	0.0004 / 0	< 0.1	**Excellent**
Long tasks (full scroll)	1 (86 ms)	4 (194 ms)	—	**Improved**
JS heap after full scroll	18 MB	16 MB	—	**Stable**

LCP element is now `/videos/hero-poster.jpg` via `priority`, with a matching `<link rel="preload" as="image">` in <head>.

4.3 Page weight — true first visit, cache disabled

VIEWPORT	ABOVE FOLD	FULL SCROLL NOW	WAS	CHANGE	LARGEST CONTRIBUTOR
Desktop 1440px	1.19 MB	**10.55 MB**	38.74 MB	**−73%**	2 MP4s = 6.78 MB
Mobile 390px	1.97 MB	**5.10 MB**	17.65 MB	**−71%**	images = 3.77 MB; **no video**

Mobile now loads no video at all — confirmed across a full 16,133 px scroll, where every `<video>` stayed at `readyState 0`. The one regression is that mobile above-the-fold rose from 1.27 MB to 1.97 MB, and images are now the dominant mobile cost (3.77 MB across 53 `next/image` requests). That is the next thing worth trimming, but it is a long way from a blocker.

4.4 Load test — concurrency 20, zero errors throughout

ROUTE	REQ/S NOW	REQ/S WAS	P50 NOW	P95 NOW	P95 WAS
`/sitemap.xml`	1,176.5	545.5	6 ms	18 ms	34 ms
`/blog`	572.5	388.6	35 ms	36 ms	63 ms
`/packages/tadiandamol-trek`	558.7	223.7	36 ms	43 ms	174 ms
`/compare`	490.2	286.8	37 ms	46 ms	107 ms
`/destinations`	**340.9**	13.4	59 ms	85 ms	2,972 ms
`/packages`	**226.4**	9.4	86 ms	125 ms	3,503 ms
`/`	165.9	114.8	112 ms	179 ms	384 ms

`/packages` improved 24× in throughput and 28× at p95. For 1,000 users/day — well under 1 req/s on average — the site now has enormous headroom on every route.

4.5 Routes — 46 probed, all correct

BEHAVIOUR	RESULT	DETAIL
Missing package / destination / post	**404**	was 200 — root `loading.tsx` removal fixed all three
Unknown path	**404**	correct before and after
`/home1–/home4`	**404**	duplicate homepages deleted
5 configured redirects	**307/308**	all resolve to the right target
13 admin routes	**gated**	client gate redirects to `/404`; no data rendered
Console errors across 27 pages	**1**	the Google reviews error — see §3
Failed sub-requests	**0**	excluding the deliberate `/404` gate fetches

4.6 Security — re-probed unauthenticated

PROBE	STATUS	RESULT
Six security response headers on /	—	**all present**, plus CSP Report-Only ✓ **new**
GET `/api/cron/quote-cleanup` (no / wrong auth)	401	constant-time compare ✓
POST / DELETE `/api/uploads/image`	404	ambiguous by design ✓
GET `/api/integrations/google-business`	404	✓
POST `/api/quotes` (no / foreign Origin)	403	CSRF gate holds ✓
POST `/api/payu/initiate` with **amount=1**	200	server signed **5998.00** — tamper rejected ✓
PayU salt in the response body	—	absent ✓
`surl` sent to PayU	—	`https://comparemytrip.in/api/payu/callback` ✓ **fixed**

PROBE	STATUS	RESULT
Storage rules	—	now `isAdmin()`, matching Firestore ✓

4.7 SEO and accessibility — 20 pages

CHECK	NOW	WAS	NOTE
Exactly one `h1`	**19/20**	16/21	auth pages fixed; only `/account` still 0
Heading-level skips	**0**	0	clean throughout
Images without `alt`	**0**	0	~1,000 images
Buttons without accessible name	**0**	0	all pages
Unlabelled inputs	**32/34 wrapped**	same	2 search inputs still placeholder-only
`aria-required` on validated fields	**4/4**	0/4	fixed
Text below 12 px on `/`	**1**	131	`/destinations` still 55
Tap targets under 44 px on `/packages`	**103/117**	103/117	unchanged — filter checkboxes 16 px
Horizontal overflow at 390 px	**0/14**	0/14	still clean
Sitemap vs noindex	**consistent**	**3 conflicts**	fixed
Canonical URL	17/20	18/21	absent on `/account`, `/checkout`, `/admin` — all noindex

5 · What is left to do

Before you can deploy at all

#	ACTION	EFFORT
1	Resolve the Firestore quota — Blaze plan with a budget alert, or wait for reset and confirm — N1	1 h
2	Add a build-time guard so a seed-data fallback **fails** the build instead of shipping placeholders — N1	1–2 h
3	Rebuild and confirm real CRM content is in the output, not `DUMMY_PACKAGES`	30 min
4	Deploy `firestore.rules` + `storage.rules`, then settle the reviews error — §3	30 min

Before taking real money (your `check:live` gate already enforces most of this)

#	ACTION	EFFORT
5	Set `NEXT_PUBLIC_RECAPTCHA_ENTERPRISE_SITE_KEY` and switch on App Check enforcement — H5	2 h
6	Set `CLOUDFLARE_R2_QUOTE_BUCKET_NAME` to a private bucket — B5	15 min
7	Publish approved legal copy and flip `LEGAL_POLICIES_APPROVED` — B6	external
8	PayU live key/salt + `PAYU_LIVE_PAYMENTS_ENABLED=true`; one real transaction	when ready

Polish

44 px hit areas on the `/packages` filters (L2) · lift the 11 px category chips on `/destinations` (L2) · trim the 3.77 MB of mobile imagery · label the two search inputs · `h1` on `/account` · one runtime check of a Firestore-backed route on a real preview deployment, to close out the `data-uri-to-buffer` warning.

> **Assessment.** The engineering here is in good shape. Thirteen of sixteen findings are closed, the fixes are well made, and several are better than what I recommended. The remaining blocker is an account-level quota, not a defect in the application — but it is genuinely blocking, because the build it produced looks successful while containing the wrong catalogue. Fix the quota, add the guard that makes that failure loud, and this is ready for a preview deployment and a real end-to-end run.

Scope and limitations. Re-tested 12 September 2026 against a clean `build:cloudflare` and a local `next start`. No application code was modified. PayU live mode and the production domain were excluded from scoring at your instruction. Firestore-backed behaviour could only be tested in its quota-exhausted state, so the rules-deployment question (§3) and the real-catalogue rendering path remain unverified. The Workers runtime itself was not exercised — the build now succeeds, but a preview deployment is still needed to confirm cold-start behaviour and the Firestore REST transport under workerd. Visual design, copy accuracy, non-Chromium browsers and authenticated admin-CRM workflows were out of scope.
