

# SEO-only Implementation Plan

## What I propose to do before any changes are made

**Your instruction:** Keep the website content and design as they are. Review the FAQ and packages section. Improve SEO without writing content for individual package detail pages.

This report replaces the content-writing recommendations in the earlier report. It contains a technical search plan, a keyword map and proposed search metadata. It contains no replacement FAQ answers, destination introductions, article copy or package descriptions.

**Business understanding:** CompareMyTrip is an independent service provider offering its own travel plans and services. The comparison feature helps customers choose between those plans. The proposed SEO will not describe the business as a vendor marketplace or an operator intermediary.

**Website:** /

**Status:** Report only. No website, source-code, CMS, DNS or deployment changes made.

**Package detail pages:** Excluded from content creation and page-specific implementation.

# 1. The decision in plain language

The site already has titles, descriptions, canonical URLs, a sitemap, robots rules and structured data. The work should correct specific issues and verify that these existing controls are consistent. A complete SEO rewrite is unnecessary.

| Decision                                 | What it means                                                                                                                                                      |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Change a small amount of search metadata | Remove the operator-based claim from the homepage description. Keep the established page titles and other useful descriptions unless a specific mismatch is found. |
| Preserve existing discovery              | Retain the main catalogue and destination pages as the search entry points. Keep filters working without creating hundreds of competing search pages.              |
| Correct technical identity where factual | Check Organization/WebSite identity, article author types, canonical URLs and social preview metadata. Do not manufacture ratings or service claims.               |
| Verify delivery and domains              | Check initial HTML, bot-readable metadata, sitemap eligibility and HTTPS/redirect behavior. Repair confirmed infrastructure issues in a later implementation step. |
| Keep all visible copy unchanged          | No changes to the FAQ answers, headings, package cards, articles, service descriptions, images, offers, prices or navigation labels.                               |

**Important limit:** The visible FAQ currently describes an operator-based comparison platform. This conflicts with your stated business model. SEO metadata cannot reliably make search engines ignore that visible text. This plan documents the conflict and leaves the FAQ unchanged, as instructed.

An implementation would be judged by accurate metadata, correct crawl/index signals and zero unintended content or behavior changes. Rankings, AI citations and the wording Google chooses to display cannot be guaranteed.

## 2. Scope and evidence

| Included                                                                                                 | Excluded                                                                                                               |
|----------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------|
| Homepage and all its sections; the FAQ on home and contact.                                              | Writing or editing any visible website content.                                                                        |
| Package listing, navigation categories, filters, sorting and card discovery.                             | Opening or auditing individual package detail pages for this revised review; writing package metadata or descriptions. |
| Destination index and existing destination hubs; comparison, blog, cruise, add-on and contact.           | New landing pages, new FAQs, new articles, new service pages or hidden keyword paragraphs.                             |
| Shared metadata, canonicals, sitemap, robots rules, structured data, social previews and domain routing. | Deleting images/deployments; video re-encoding; changing prices, offers, bookings or enquiry flow.                     |
| Read-only source inspection to explain what is deployed and what is merely local.                        | Publishing, deploying, editing Firestore or changing domain configuration during this report.                          |

### What was rechecked for this revision

Nineteen live URLs were requested: eight main pages, nine package filter URLs, robots.txt and sitemap.xml. All returned HTTP 200. The package listing was also inspected in the browser; the Honeymoon filter reduced the visible cards from 60 to 13. No package detail link was opened in this revised check.

### Broader coverage retained from the same-day audit

The earlier audit checked 61 in-scope sitemap URLs: 8 main pages, 43 destination hubs and 10 articles. They returned 200 and had distinct page metadata and H1s. The destination/article inventory is included at the end. Those 53 child pages were not all fetched again during this revision.

### Evidence limits

No Search Console, analytics, paid keyword research or private business records were accessed. Package counts are a snapshot, not a fixed SEO requirement or an audit of how many packages you personally uploaded. Local unpublished changes are not assumed to be live.

### 3. FAQ: what I found

The FAQ exists on both the homepage and contact page. Six questions and their answers are present in the initial HTML, using details/summary elements. The FAQ is already crawlable; it does not need a rewrite or a new page simply to expose its answers.

| Existing question                         | Finding and SEO-only treatment                                                                                                                                                                                              |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Do you sell the packages yourself?        | The answer describes a comparison platform and third-party delivery. This conflicts with your independent-provider instruction. Record the contradiction; preserve the answer; do not repeat that claim in new metadata.    |
| Is the price on the card the price I pay? | The answer attributes the quote to an operator and makes price/tax promises. Preserve it. Do not turn those promises into Offer schema or search-description guarantees without verification.                               |
| How do I compare two packages properly?   | The answer explains the comparison table. Keep the question, answer and interaction. Preserve semantic HTML and the existing linkable FAQ section.                                                                          |
| What happens after I send an enquiry?     | The answer says an enquiry is shared with an operator. This conflicts with your stated model. Leave the answer unchanged and do not encode operator routing in structured data.                                             |
| Can I change or cancel after booking?     | The answer contains a 15-day/free-cancellation claim for some packages. Its operational accuracy was not verified because package details and policies are outside this review. Do not promote it as a site-wide guarantee. |
| Are the reviews real?                     | The answer describes review collection and publication practices. Those internal processes were not audited. Do not infer an Organization aggregate rating from this answer.                                                |

**Locations:** [/#faq](#) and [/contact#faq](#). The descriptions above are observations, not replacement answers. A contradiction with your instruction is identified separately from a claim whose accuracy could not be verified.

## 4. FAQ: what I would and would not do

### Keep the current presentation

Retain the same six questions, answers, ordering, accordion behavior and section headings. Preserve the existing details/summary markup. Do not add a keyword-stuffed heading or create another FAQ page.

### Verify the published content reaches the first response

Compare the published CMS values with initial HTML and the fully loaded page. If they differ, investigate the content-delivery path. Any later rendering adjustment must deliver exactly the already-published text, with no wording changes. The current check confirms answers are present; it does not justify automatically rebuilding the component.

### Do not add FAQPage as a promised Google feature

Google states that FAQ rich results stopped appearing from 7 May 2026. Its FAQ rich-result documentation was removed in June. Adding FAQPage is therefore not a useful deliverable for obtaining that feature. The ordinary FAQ can still help readers and be understood as page content. [R1]

### Do not create conflicting hidden answers

No alternate answers inside JSON-LD, hidden HTML, bot-only text or an AI instruction file. Structured data must accurately represent the page. The independent-provider statement will guide proposed search wording, but expanded business-model claims in schema are deferred while the visible FAQ conflicts with them. [R2]

**Remaining issue after SEO-only work:** A search engine or answer engine may still quote the existing operator-based FAQ. Keeping that copy unchanged means accepting this residual identity conflict. This report does not claim that metadata can eliminate it.

### AEO within this scope

AEO means helping answer engines understand and retrieve the existing pages. Here, the practical work is sound indexing, stable URLs, accessible existing text and accurate entity references. There is no promise of an AI citation and no requirement to add an llms.txt file for Google. [R3]

# 5. Packages: section-by-section review

The catalogue currently shows 60 package cards. This is the live listing count; it does not contradict your statement that you manually uploaded 36 packages. No conclusion about the origins of the other records is made.

| Section                            | Finding / proposed treatment                                                                                                                                                                         |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Heading and introduction           | One H1, Holiday packages, followed by a count and price note. Keep all visible wording and numbers driven by the existing data.                                                                      |
| Package cards                      | Sixty cards and detail links are present in initial HTML. Preserve names, prices, photos, badges, ratings, accommodation and links. Do not rewrite card content or fetch detail pages for this plan. |
| Best deals                         | A switch identifies 21 deals in the observed catalogue. Keep the existing selection logic. Do not hard-code discount percentages or this count into metadata.                                        |
| Destination filters                | Forty-three destination choices are visible. Keep filtering; use existing destination hubs as the main destination search URLs.                                                                      |
| Travel styles                      | Honeymoon, Family, Adventure, Treks, Beaches, Mountains, Heritage, Wildlife, Luxury, Spiritual, Cruise and Hotels are visible. Honeymoon returned 13 cards in the browser check. Keep all controls.  |
| Budget, duration, hotel and rating | Keep sliders and selections. Do not create indexable URLs for every combination. A zero-count choice is not by itself an SEO error.                                                                  |
| Sorting and Compare                | Recommended, price and rating sorting plus Compare buttons are present. Preserve interaction and selection state; no change to comparison behavior is proposed.                                      |

This was an SEO review, not exhaustive functional testing of every filter combination. If implemented later, representative combinations and clear/reset behavior would be regression-tested.

## 6. Package filter URLs and indexing

All nine sampled filter URLs returned 200 with the catalogue title and description, index/follow and a canonical pointing to /packages. Their initial HTML uses the shared catalogue before browser filtering. This is a consolidated catalogue design, not nine missing unique SEO pages.

| Checked query on /packages | Intended SEO handling                                                                               |
|----------------------------|-----------------------------------------------------------------------------------------------------|
| ?region=india              | Preserve canonical to /packages; retain visitor filter.                                             |
| ?region=international      | Preserve canonical to /packages; retain visitor filter.                                             |
| ?deals=1                   | Preserve canonical to /packages; do not publish volatile deal counts in the description.            |
| ?category=weekend-treks    | Preserve canonical to /packages; keep existing navigation.                                          |
| ?category=sunrise          | Preserve canonical to /packages.                                                                    |
| ?category=monsoon          | Preserve canonical to /packages.                                                                    |
| ?category=escapes          | Preserve canonical to /packages.                                                                    |
| ?type=honeymoon            | Preserve canonical to /packages.                                                                    |
| ?destination=Kerala        | Preserve canonical to /packages; existing /destinations/kerala remains the destination search page. |

### What I would implement

Retain the current canonical policy and keep query combinations out of the XML sitemap. Validate that shared metadata and internal references consistently use the clean catalogue URL. No separate title campaign, landing page or new introductory text for these filters is included.

### What needs measurement first

Canonical URLs are signals, not guaranteed exclusions from search. If Search Console later shows wasteful query crawling or indexed duplicates, design a targeted crawl-control change using that evidence. Do not blanket-block parameters or combine a new noindex rule with canonicals without a specific objective. [R4, R5]

## 7. Homepage: preserve every visible section

The homepage is one search page with many useful sections. It does not need a separate keyword block or schema object for every panel.

| Existing section group                                   | SEO-only plan                                                                                                                                                                                                   |
|----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Promotion strip, header, hero and search                 | Preserve offer, phone, H1, video and form. Correct only the homepage search description. Validate logo and primary navigation links as they already exist.                                                      |
| Top picks, featured packages and travel styles           | Preserve cards, tabs and the featured shuffle. Verify genuine links and current published text are available consistently. No new package copy.                                                                 |
| Trending destinations, domestic and international panels | Preserve captions, prices and imagery. Audit existing destinations/links; no new destination paragraphs, keyword additions or travel claims.                                                                    |
| Comparison section                                       | Keep all slots and calculations. Preserve the comparison-page canonical; no rating or best-price schema inferred from the widget.                                                                               |
| Weekend treks                                            | Retain cards and text. Earlier audit found broken card targets; recheck before any repair. URL repair or catalogue remapping is a separate navigation/content-maintenance decision, not silently included here. |
| Brand banner and Why travel with us                      | No copy changes. Do not copy partner counts, guarantees or operator wording into new SEO fields.                                                                                                                |
| Latest deals and travel gallery                          | Keep visuals and dynamic offers. No stale discount values in evergreen metadata; reuse existing representative imagery for social previews only if suitable.                                                    |
| FAQ, reviews, enquiry calls to action and footer         | Preserve all text, reviews, links and forms. Apply the FAQ limits from sections 3-4. Do not manufacture review schema or replace footer positioning.                                                            |

Some visible operator/partner wording remains outside the FAQ too. It is recorded as a business-identity limitation, not an instruction to rewrite those sections. Performance and video changes from the earlier task are outside this report.

## 8. Other website sections

| Page family                                                                                                                                          | What I would do for SEO                                                                                                                                                                                                                              |
|------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| /destinations and 43 destination hubs                                                                                                                | Keep the existing unique titles, descriptions, H1s, cards and Breadcrumb/ItemList data where accurate. Verify self-canonicals and sitemap inclusion for live hubs. No new introductions, city pages or destination FAQ text.                         |
| /compare                                                                                                                                             | Keep its existing metadata and canonical. Do not index every user-selected comparison as a new landing page. Do not add Product or rating data based on a temporary shortlist.                                                                       |
| /blog and 10 articles                                                                                                                                | Keep current article text, URLs, headings and SEO overrides. Check Article/BlogPosting fields. Where the displayed author is the brand, use an Organization author rather than a Person named CompareMyTrip. Retain real personal authors as Person. |
| /cruise                                                                                                                                              | Keep current title and description in this phase. Mentioning cruise lines does not automatically make CompareMyTrip a marketplace. Do not invent ship ownership, commissions, lowest fares or guarantee claims.                                      |
| /add-on and service tabs                                                                                                                             | Keep the one-page service model and existing tab behavior. Review the proposed shorter search title. Do not split flights/hotels/visa/transport into new landing pages. Retain existing tab index controls unless evidence shows a defect.           |
| /contact                                                                                                                                             | Keep enquiry form, contact text and metadata. Verify any machine-readable phone/address matches the published contact source; do not add unverified business details. Preserve the shared FAQ.                                                       |
| Shared footer, legal and private routes                                                                                                              | Preserve visible content. Keep account/admin/checkout/auth pages out of the public search strategy. Existing draft legal pages remain outside sitemap/indexing until separately approved; no legal-policy writing is included.                       |
| Existing healthy pages are validation work, not a reason to change their titles or content. The implementation should have a small, reviewable diff. |                                                                                                                                                                                                                                                      |

## 9. Exact proposed search metadata

These are proposed title/description changes only. Titles can appear in browser tabs and search results; descriptions can influence search snippets. Matching Open Graph and Twitter text can affect shared-link previews. None of this changes the visible page headings or body text.

### Homepage: one necessary description correction

**URL:** /

**Title:** Keep the current title: Compare Travel Packages Before You Book | CompareMyTrip

**Current issue:** Its description attributes packages to trusted operators, contrary to your business instruction.

**Proposed description:** Explore CompareMyTrip travel plans in India and abroad. Compare itineraries, prices and inclusions, and enquire directly with our travel team.

### Add-on page: optional title simplification

**URL:** /add-on

**Current title:** Flight, Hotel, Visa, Transport and Bring Your Quote Enquiries | CompareMyTrip

**Proposed title:** Flights, Hotels, Visa & Transport | CompareMyTrip

**Description:** Keep the current description, including its Bring Your Quote reference. The form and service-tab labels stay unchanged. This title change is optional; it is not required to index the page.

### Shared default metadata

Keep the current neutral default description unless an actual fallback occurrence is inaccurate. Do not change a shared default merely to refresh wording. If a shared tag must change, inspect its effect on every route family before accepting the change.

### Open Graph and Twitter

Where the homepage social description repeats the old operator-based description, align it with the proposed homepage description. Preserve the existing suitable image. Check absolute image URLs, URL consistency and duplicate tags. Do not create new campaign copy or visuals.

No title/description text is proposed for individual package detail pages. Global identity or domain repairs can affect shared tags on those pages; those effects must be disclosed and tested without editing their content.

Search engines can choose different title links and snippets from page content. The FAQ identity conflict therefore remains even after the homepage description is corrected. [R6, R7]

## 10. Metadata I recommend keeping

The following current metadata already describes the page intent. Preserve it rather than changing it just to add more keywords.

### /packages

**Title:** Holiday Packages with Itineraries and Prices | CompareMyTrip

**Description:** Browse holiday packages with day-by-day itineraries, inclusions, exclusions and prices, then compare your shortlist side by side.

### /destinations

**Title:** Travel Destinations in India and Abroad | CompareMyTrip

**Description:** Explore destinations covered by CompareMyTrip, with available package counts, trip lengths and starting prices.

### /compare

**Title:** Compare Holiday Packages Side by Side | CompareMyTrip

**Description:** Put up to three shortlisted packages side by side - duration, price, accommodation, meals, flights and cancellation terms in one table.

### /blog

**Title:** Travel Guides and Trip Planning Advice | CompareMyTrip

**Description:** Destination guides, itineraries and practical travel advice from the CompareMyTrip travel desk.

### /cruise

**Title:** Cruise Holidays | CompareMyTrip

**Description:** Compare cruise lines sailing from India and worldwide. Request a quote or download a brochure for the cruise you like.

### /contact

**Title:** Contact the Travel Desk | CompareMyTrip

**Description:** Send an enquiry and our travel desk will come back with package options that match the trip you have in mind.

Retain the existing unique destination and article metadata, including published article SEO overrides. Reassess only a specific mismatch, duplicate or unsupported claim found during implementation. Do not bulk-generate descriptions from keyword lists.

# 11. Keyword map, without adding body content

These are relevance-based target phrases, not measured search volumes or ranking forecasts. They guide page ownership and future reporting; they are not a list to paste into every page. There is no proposed meta-keywords tag.

| Existing page               | Primary intent / supporting phrases                                                                                                                                                       |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Homepage                    | CompareMyTrip; CompareMyTrip travel plans; compare travel packages. Emphasize the brand and comparison of its own plans.                                                                  |
| /packages                   | holiday packages; India holiday packages; international holiday packages; holiday itineraries and prices.                                                                                 |
| /destinations               | travel destinations in India; international holiday destinations; destinations for holiday packages.                                                                                      |
| Existing destination hubs   | [destination] holiday packages; [destination] trip packages; [destination] itineraries. Examples: Kerala, Goa, Rajasthan, Thailand, Maldives. Only use a destination already represented. |
| /compare                    | compare holiday packages; compare trip itineraries; compare package inclusions. No vendor/operator comparisons.                                                                           |
| /blog and existing articles | travel planning guides; article-specific trip planning intent. Examples: three days in Munnar, Kerala houseboat guide, weekend treks from Bengaluru.                                      |
| /cruise                     | cruise holidays; cruise holiday enquiry. Specific departures only if supported by the existing page.                                                                                      |
| /add-on                     | flight enquiry; hotel enquiry; visa assistance; airport transfers; outstation cab enquiry. Keep one existing service page.                                                                |
| /contact                    | contact CompareMyTrip; CompareMyTrip travel enquiry; CompareMyTrip travel team.                                                                                                           |

## Avoid business-model and promise keywords

Do not target vendor marketplace, operator directory, travel middleman or third-party package aggregator. Do not add lowest price, guaranteed visa, guaranteed refunds or operator verification as SEO claims. Independent service provider does not imply ownership of airlines, hotels or ships.

Destination hubs and articles serve different intent: packages on hubs, advice on guides. Keeping that distinction avoids forcing the same keyword target across all page families.

## 12. Structured data and AEO work

| Data type / item                   | Exact proposed treatment                                                                                                                                                                                               |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Organization + WebSite             | Already present. Validate the existing entity IDs, brand name, preferred URL and logo. Keep one connected identity. Do not add marketplace roles, fake affiliates, unsupported sameAs profiles or an invented address. |
| Independent-provider wording       | Use the user-confirmed business model to avoid false search metadata. Defer expanded service-provider claims in schema while visible FAQ text conflicts; no hidden replacement narrative.                              |
| BlogPosting / Article author       | Inspect the displayed author per article. Brand bylines should reference an Organization; named human authors should remain Person. Preserve visible bylines and article content.                                      |
| Article dates and images           | Use actual publication/modification values and the existing representative image. Do not refresh dates just to appear recent. Omit unavailable facts instead of inventing them.                                        |
| BreadcrumbList / ItemList          | Validate existing destination markup against visible links and cards. A catalogue CollectionPage/ItemList is optional, not a priority fix or a promise of a rich result. It must describe the visible list.            |
| FAQPage                            | Do not add as a Google FAQ rich-result task. Keep readable FAQ HTML; do not encode alternate answers.                                                                                                                  |
| Product, Offer and aggregateRating | No additions to package detail pages under this scope. Do not derive site-wide prices, ratings, cancellations or availability promises from summary cards or testimonials.                                             |

Structured data is machine-readable description, not a way to override contradictory page text. Validate syntax and page correspondence; passing a validator does not guarantee search eligibility or display. [R2, R8]

### What AEO success means here

The site is technically eligible to be retrieved, has stable page identities and provides readable existing information. Whether an answer engine cites it depends on that system and the query. The plan does not promise a particular AI answer or rank. [R3]

## 13. Crawl, sitemap and domain work

### Canonicals and sitemap

Retain <https://comparemytrip.in> as the preferred origin. Check one absolute canonical per indexable page. Main pages, destination hubs and articles should point to their own clean URLs; catalogue filters retain /packages. Exclude tracking parameters, account routes and duplicate URLs from the sitemap. Keep existing package sitemap eligibility rules unchanged in this scope. [R5]

### Robots rules

The existing file lists the sitemap and excludes admin/API/account/checkout/auth paths. Verify those rules stay intact. Do not use robots.txt as a security control or as proof that a URL cannot be indexed. Public search pages must not be accidentally blocked. Do not add a broad filter ban without crawl evidence. [R4, R9]

### Last-modified values

Use real content-update dates where available. Do not stamp every sitemap URL with today on every build. No priority or change-frequency adjustment is proposed as a ranking fix.

### HTTPS and alternate domains

Earlier same-day requests found an HTTPS certificate problem on the www hostname; the HTTP root redirected to HTTPS. Reproduce the www failure first, then correct certificate/domain mapping and redirect to the preferred host if it persists. A canonical tag cannot repair a TLS failure.

### Vercel deployment alias

The earlier check found a public deployment alias returning 200 with a production canonical. During implementation, inspect the hosting configuration and distinguish preview aliases from the production hostname. Protect/noindex previews or redirect a redundant public alias where appropriate, without accidentally blocking production. This requires configuration work, not page-copy changes.

Domain and hosting configuration changes are proposed only. No certificate, redirect, protection rule or deployment was changed for this report. Package URLs are not renamed and existing package sitemap entries are not removed.

# 14. Proposed implementation files and limits

This is a review list for a future implementation, not a statement that every listed file needs an edit. Existing uncommitted work must be preserved and evaluated separately.

| Candidate location                       | Permitted purpose in this plan                                                                                                                                                        |
|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| src/app/page.tsx                         | Correct the homepage metadata description; keep body components and copy intact.                                                                                                      |
| src/app/add-on/page.tsx                  | Optional shorter metadata title only; no tab, form or content changes.                                                                                                                |
| src/lib/seo.ts and src/app/layout.tsx    | Check canonical origin, metadata inheritance, social previews and shared Organization/WebSite identity. Change only a confirmed defect.                                               |
| src/app/blog/[slug]/page.tsx             | Correct brand-versus-person author typing in structured data; preserve displayed byline, article and existing SEO overrides.                                                          |
| src/app/robots.ts and src/app/sitemap.ts | Validate current exclusions, eligible URLs, deduplication and dates. No package publication/eligibility rule rewrite.                                                                 |
| Destination and catalogue templates      | Validate current canonicals, metadata and schema. Preserve filters, cards and URL behavior. No new listing copy.                                                                      |
| Content delivery / server helpers        | Only if initial HTML differs from the approved published content: a narrowly scoped delivery fix with exact text-equivalence testing. Reuse existing work rather than duplicating it. |
| Hosting configuration                    | Reproduce and address www/alias issues in a separately reviewable configuration step. No speculative domain migration.                                                                |

**Do not edit:** CMS content documents, FAQ answer strings, marketing sections, article bodies, package descriptions, package detail templates for new SEO content, prices, reviews, testimonials, legal text or media assets. No database write is needed for this report.

# 15. Step-by-step execution after review

| Step                                    | Work and acceptance gate                                                                                                                                                                         |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1. Capture baseline                     | Record deployed revision, current metadata and normalized visible text/screenshots on representative pages. Separate existing unpublished work. Keep CMS untouched.                              |
| 2. Correct search wording               | Apply the homepage description correction and optionally the add-on title. Align affected social fields. Gate: exact agreed strings, one title/description, no body-text diff.                   |
| 3. Check canonical/index controls       | Validate clean origins, filters, sitemap and private-route exclusions. Edit only confirmed defects. Gate: no canonical loops, duplicate sitemap URLs or newly blocked public pages.              |
| 4. Correct schema accuracy              | Fix brand author typing where confirmed; validate shared entity references and existing destination schema. Gate: accurate fields, valid JSON-LD, no invented promises or alternate FAQ answers. |
| 5. Verify rendering fidelity            | Compare initial HTML, fully loaded page and published content for key sections. Gate: same approved content and functioning filters/FAQ; any fix limited to delivery.                            |
| 6. Address domain configuration         | Recheck certificate/alias findings; apply only the necessary configuration changes. Gate: HTTPS works before redirect, preferred origin stays reachable, production is indexable.                |
| 7. Review the complete diff             | Show all edited files, before/after metadata and configuration impact. Gate: no website-copy or individual-package edits and all relevant checks pass.                                           |
| 8. Publish and measure, when authorized | After implementation review, deploy the approved revision and verify live output. Use Search Console if access is supplied. Observe rather than promise indexing or ranking changes.             |

This document is the requested pre-implementation report. It does not initiate the steps above or authorize a deployment. Separate performance work is not folded into this SEO change.

# 16. How I would prove the site is unchanged

| Check                | Passing result                                                                                                                                                                                                            |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source/CMS integrity | Only agreed metadata/schema/configuration files change. No CMS write and no package content diff. Preserve pre-existing local changes.                                                                                    |
| Visible copy         | Compare normalized headings, paragraphs, FAQ answers, buttons and card text with baseline. Account explicitly for legitimate catalogue updates and randomized featured ordering. No invented tolerances for missing text. |
| Visual check         | Same representative desktop/mobile layout, images, hero behavior and accordion presentation. No redesigned content blocks.                                                                                                |
| Interaction check    | FAQ opens/closes; destination/style/deal filters and reset work; sorting and Compare still work. Contact/add-on UI loads without submitting enquiries.                                                                    |
| Metadata check       | One correct title, description and canonical on each checked route; existing article/destination overrides preserved; no doubled brand suffix.                                                                            |
| Indexing check       | Public target pages remain indexable. Existing private/draft restrictions retained. Query filters remain consolidated; sitemap remains valid XML.                                                                         |
| Schema check         | Parse JSON-LD and validate applicable types. Confirm values match visible content, genuine authors and existing URLs.                                                                                                     |
| Build and live check | Run the project build and relevant existing checks for changed files. Inspect initial HTML and loaded DOM after deployment, including representative bot responses. Do not claim a pass before running it.                |

## Shared-change boundary

A root metadata or domain fix can technically affect package pages even when no package-specific file is edited. Any such effect must be stated in the implementation diff. It does not permit changing the manually uploaded package text, card data or detail descriptions.

## Rollback

Keep the implementation as a small separate revision with its own metadata/configuration diff. Revert only that revision if needed, preserving catalogue updates and previous performance work.

# 17. Measurement and unresolved limits

## What can be established now

The inspected pages respond, contain search metadata and expose useful content. The FAQ has a specific identity conflict; the homepage search description repeats the operator model. Those observations support targeted work, not a prediction of traffic growth.

## What requires account access later

Search Console would show indexed pages, Google-selected canonicals, crawl problems, query impressions and clicks. Analytics, if already installed, could connect organic visits to existing enquiry events. No account configuration, tracking installation or new data collection is proposed in this report.

## Suggested monitoring

Save a baseline before deployment. Check live technical output immediately after release. Review indexing/canonical reports after recrawling, then compare a practical reporting window such as the following 28 days with the prior period. Record promotions and seasonality. A 28-day window is a measurement choice, not a promised SEO turnaround.

| Remaining limitation                                | Consequence                                                                                                                                                               |
|-----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FAQ/body identity remains unchanged                 | Search and AI systems may still describe an operator-based business. The proposed metadata reduces repetition of the error but cannot guarantee corrected interpretation. |
| Package detail pages excluded                       | No completeness claim about their content, metadata, prices, policies or schema. Listing review does not validate every detail page.                                      |
| Claims not backed by business records in this audit | Do not promote review authenticity, cancellation promises, awards or service guarantees into new schema. This is not a finding that those claims are necessarily false.   |
| No search-performance dataset                       | Keywords are sensible relevance targets; their volume, competition and conversion performance are unverified.                                                             |
| Earlier broken links / content inconsistencies      | Recorded for separate maintenance. No copy, catalogue mapping or navigation change is silently added to this SEO-only scope.                                              |

## 18. Reviewed destination inventory

These 43 existing destination hubs were included in the earlier same-day HTTP audit. All returned 200. Their current content is retained; this list is not a proposal for new pages. URLs use /destinations/ followed by the slug shown.

| Existing hub                                                        | Existing hub                                                                | Existing hub                                                          |
|---------------------------------------------------------------------|-----------------------------------------------------------------------------|-----------------------------------------------------------------------|

For these pages, the work is verification of existing metadata, self-canonicals, sitemap eligibility and matching list/breadcrumb markup. No description paragraphs, FAQs, itineraries or package details would be authored. The live URL spelling is retained, including srilanka; changing slugs is not part of this plan.

## 19. Reviewed article inventory

These ten existing guides were included in the earlier same-day HTTP audit and returned 200. Keep their visible copy, headings, URLs, dates and author bylines.

| Existing guide                                      | SEO-only check                                                                            |
|-----------------------------------------------------|-------------------------------------------------------------------------------------------|
| <a href="#">/blog/three-days-in-munnar</a>          | Preserve content and SEO override; verify canonical, actual dates, image and author type. |
| <a href="#">/blog/choosing-a-kerala-houseboat</a>   | Preserve content and SEO override; verify canonical, actual dates, image and author type. |

### Main page inventory

The revised live checks also covered [/](#), [/packages](#), [/destinations](#), [/compare](#), [/blog](#), [/cruise](#), [/add-on](#) and [/contact](#). Package query checks are listed in section 6. No new page or new article is proposed.

## 20. Sources and evidence notes

Website findings come from live page responses, browser inspection and read-only source inspection on 25 September 2026. The earlier same-day audit supplies the destination/article inventory and specifically labelled domain/link observations. Recommendations are distinguished from deployed behavior throughout.

### Local implementation guidance

The installed Next.js metadata guide was reviewed for this plan:

node\_modules/next/dist/docs/01-app/01-getting-started/14-metadata-and-og-images.md. Future metadata changes should use this project version's Metadata/generateMetadata conventions, not manually inject duplicate tags.

**Delivered outcome:** A revised SEO-only plan for review. No visible content changes, no new package-detail content and no implementation performed.
