

Production readiness audit

comparemytrip.in | Live website + current local working tree | 13 September 2026

LAUNCH RECOMMENDATION

NO-GO

Resolve the blocking findings before accepting real bookings and payments. The website is publicly open; critical customer and operational flows still need completion and verification.

90

public pages

199

URLs per origin

804

HTTP checks

13

findings

What prevents launch

Money and booking integrity: published prices differ from checkout; an invented URL displays a paid receipt; payment handoff survives booking-storage failure.

Service readiness: App Check is unenforced, quote-PDF storage is unconfigured in the inspected environment, and live payment/policy release gates fail.

Customer trust: a test product is public, commercial promises need reconciliation, and the package success page promises email that is not implemented.

Strengths: 131 automated tests, production build/TypeScript, lint, asset checks and both smoke modes pass. All 76 sitemap pages and all 372 checked image responses pass. These results support the codebase, while the launch blockers remain.

7 P1 launch blockers + 6 P2 customer-flow defects. Real purchases, refunds, email delivery, customer CRUD and private uploads were not performed during this audit.

What was examined

Coverage reflects observed routes and selected interactions, not a claim that every possible state was exercised.

Surface	Coverage	Interpretation
Live + local	https://comparemytrip.in and http://localhost:3100	Same URL inventory checked on the live site and fresh local production build.
Public content	90 HTML pages: 40 packages, 22 destinations, 10 articles, 18 other pages	Browser audit visited every package, destination and article; HTTP checked all discovered routes.
Admin	13 admin pages visited in browser; anonymous access gates also tested	Render/access and read views were examined. Successful CRM create/edit/delete was not tested.
Routes and resources	199 URLs per origin = 398 GETs; 17 APIs x 2 = 34 GETs; 186 images x 2 = 372 HEADs	804 aggregate HTTP checks; query/filter/checkout variants count as URLs, not separate page designs.
Discovery	Source routes, sitemap, rendered links, query variants and legacy redirects	Recursive inventory finished with zero untested discovered internal URLs.
Application internals	Payment/auth, Firestore rules, uploads, cron, release config, customer validation	Source review, safe service reads and isolated mocked failure probes supplemented browser observations.

How evidence is labeled

Live/browser: visible behavior in the deployed website. **HTTP:** status, headers or returned markup. **Source:** implementation inspected without exercising a production mutation. **Isolated:** actual functions run with safe mocked dependencies. **Gap:** not verified; requires acceptance evidence.

State changes and revision limits

The site initially redirected public visitors to coming-soon. The user explicitly authorized the auditor to disable that CMS switch; the report reflects the open website after publication. No purchase, lead, account, email or upload was created for testing. Browser comparison selections were exercised locally.

The working tree already contained uncommitted changes. This audit preserved them and did not implement or deploy fixes. Local source findings may therefore differ from the deployed revision; live reproductions are labeled explicitly. Framework build/static entries are not used as a unique website-page count.

Checks that passed

Successful controls reduce uncertainty; they do not override a reproduced business or payment defect.

Check	Result	Practical limit
Automated tests	131 / 131 passed	Mocked logic and regression coverage; not real gateway/account E2E.
Lint	Exit 0; no errors or warnings	Source diagnostics only.
Build + TypeScript	Production build passed	Successful compilation does not prove remote service readiness.
Asset budget	129 assets; 68.51 MiB	File/budget policy passed; mobile Web Vitals still unmeasured.
Smoke tests	41 maintenance + 37 full-site checks passed	Safe requests and denied mutations; no bookings created.
Dependency advisories	0 known vulnerabilities in current scan	Point-in-time registry information, not penetration-test certification.
Google auth config	Authorized domains/helpers/provider all passed	Real consent, return and reset delivery not completed.
Protected database reads	6 anonymous data probes returned 403	Contact/newsletter/users/trips/admins/integration reads denied.
Sitemap + images	76 sitemap URLs 200; 372 image HEADs 200 with image MIME	Image alternates, all visual states and physical-device performance are separate.
Route responses	Each origin: 187 x 200, 6 x 404, 5 x 308, 1 x 307	404s/redirects matched intended cases; details in the appendix.

Controls visible in source

PayU callbacks verify the response hash and merchant key. Payment records use transactional, monotonic settlement; customer payment routes check ownership; client rules prohibit payment-status edits. Admin APIs check verified identity and membership.

Quote access is admin-restricted, expires independently of cron and uses short-lived signed links. Security headers include HSTS, nosniff, frame denial and a limited enforced CSP. The broader CSP is report-only.

Release checks fail: missing private quote bucket and Enterprise App Check key. Live-mode checks additionally fail on disabled live PayU, unapproved policies, and missing legal business name, address and support email.

Interaction coverage

Pass means the stated interaction passed. It does not imply payment, persistence or delivery was tested.

Journey	Result	What was actually checked
Public page rendering	PASS - inspection	All 40 packages, 22 destinations and 10 articles visited; no blank/error body or loaded broken image observed at inspection time.
Catalogue / comparison	PASS - selected flows	Kerala filter 40 to 4; clear restored list; ascending prices correct. Compare chooser produced a two-column table.
Package controls	PASS	Travellers 2 to 3 updated total; calendar restricted weekdays/past dates; chosen 21 Sep and party carried into checkout.
Gallery / itinerary	PASS - limited	Gallery advanced 1 to 2 of 10 and closed. Three-page itinerary downloaded; text/title/INR 3,009 price checked, not full visual QA.
Mobile navigation/filter	PASS - sampled	390x844 menu and Kerala filter drawer worked; no observed horizontal overflow in the sampled variants.
Anonymous auth UI	PASS / AUTH UNTESTED	Empty login/signup/reset validation, password toggles and Remember me worked. No real auth or email delivery.
Signed-out account	DEFECT L13	Plain /login loses the intended account return. Admin next destination was preserved through reset navigation.
Signed-in account	PASS - read only	Bookings/quote/profile sections rendered; section navigation worked. No private details or data edits reproduced.
Admin sections	PASS - read only	13 sections loaded; Kumara search returned one record. Only user-authorized coming-soon switch was published.
Checkout / coupon	DEFECT / VALIDATION PASS	Live price mismatch and fake receipt reproduced. Invalid code returned a clear rejection; no payment initiated.
Contact / package quote	VALIDATION PASS	Missing message/date produced field errors; contact aria-invalid set. No successful submission.
Add-ons / custom pay	VALIDATION PASS	One-way hid return; missing flight details errored; hotel/visa/BYQ tabs changed fields. Empty custom pay was blocked.
Blog / destinations	PASS	Munnar search returned one article; Kerala one destination; International displayed 12 cards.
PDF / gateway / refunds	UNTESTED	No quote file uploaded, transaction completed, transactional email delivered or refund executed.

Evidence: browser-final-notes.md, auth-ui.md and route matrix. Desktop measured 1470 CSS pixels; phone measured 390x844. The 116 raw browser entries and 22 mobile measurements include repeats and are not distinct-page/pass counts.

Prioritized defects

Seven P1 launch blockers and six P2 customer-flow issues. Evidence type is explicit in each detailed finding.

ID	Priority	Finding	Evidence
L01	P1	Catalogue / checkout price mismatch	Live + source
L02	P1	Invented URL displays paid receipt	Live + source
L03	P1	Payment handoff despite storage failure	Isolated + source
L04	P1	App Check missing / unenforced	Remote config
L05	P1	Private quote bucket not configured	Local config + source
L06	P1	Live payments / policies / promises unfinished	Live + config + source
L07	P1	Public test product and derived destination	Live + HTTP
L08	P2	Promised package email not implemented	Source
L09	P2	Dates and party lost after hero search	Browser party / source dates
L10	P2	Budget band excludes cheaper qualifying trips	Public data + source
L11	P2	Form limits/date validation inconsistent	Isolated + source
L12	P2	Inert Kerala Save / callback controls	Live + source
L13	P2	Account destination lost at login	Browser + source

Priority definitions

P1: resolve before taking real bookings/payments or promoting the affected launch workflow. **P2:** fix before broad promotion; a temporary manual workflow is acceptable only when accurate customer copy and operational ownership are established.

No critical ledger compromise or successful unauthorized private-data access was demonstrated. The spoofed receipt is a customer-visible claim, not evidence that the gateway hash or stored payment status can be forged.

Price and receipt integrity

L01 / P1**Published price and checkout disagree**

Evidence. LIVE: Kumara Parvatha is INR 3,009/person; checkout uses INR 3,499. For 3 travellers the visible total increases from INR 9,027 to INR 10,497 (INR 1,470). Firestore has 40 products; payment seed has 39.

Reproduce. Open /packages/kumara-parvatha-trek, wait for live data, set 3 travellers, then open checkout. Compare the total before any payment.

Why it matters. Customers face an inconsistent amount. New CMS products have no seed checkout match; publication/departure edits also miss that payment authority.

Pass condition. Use one authoritative published server catalogue across display, checkout, coupon preview and signing. Verify every product, edited price and unpublished ID.

Source: src/lib/payu.ts:48; src/app/checkout/page.tsx:57; src/app/api/payu/initiate/route.ts:50; src/lib/serverContent.ts:44

L02 / P1**A query string can claim payment success**

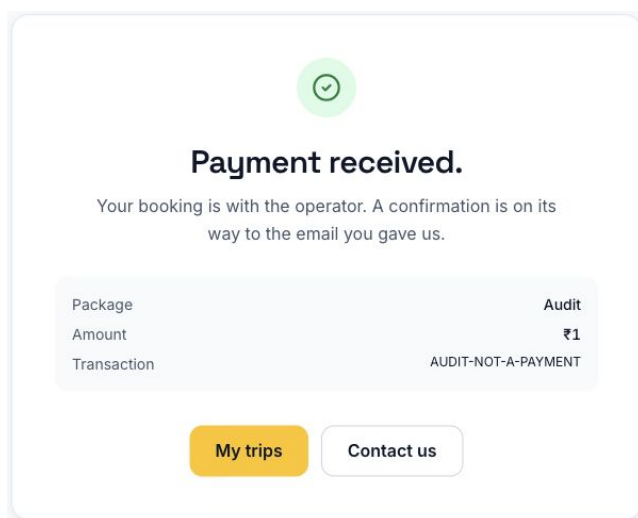

Evidence. LIVE: /checkout/status?state=success&txnId=AUDIT-NOT-A-PAYMENT&amount=1&item=Audit displays Payment received and the invented amount/reference.

Reproduce. Open that URL directly in a browser. It is a GET; no transaction or booking is created.

Why it matters. The fake receipt can mislead customers and support staff. This is display spoofing; no ledger mutation or callback-signature bypass was shown.

Pass condition. Read persisted verified transaction state through an authorized or appropriately signed receipt lookup. Unknown and tampered references stay unconfirmed.

Source: src/app/checkout/status/page.tsx:43-64; custom-payment persisted lookup: src/app/pay/status/page.tsx:14-22

Live receipt card, reached by a GET with an invented transaction. No payment was created.

Reproduced price difference

Kumara Parvatha / 3 travellers

Package detail: **INR 9,027**

Checkout: **INR 10,497**

Difference: **INR 1,470 higher**

Same selected date and party. No payment submitted.

Persistence and abuse controls

L03 / P1

Payment handoff survives booking-storage failure

Evidence. ISOLATED: real initiation code with fake merchant credentials and mocked createPendingTrip returning false or throwing still produces HTTP 200 and a self-submitting PayU form.

Reproduce. Run the initiation route in an isolated harness with either storage failure. Observe the returned form; do not submit it to a gateway.

Why it matters. A customer can reach payment without a durable booking. If callback persistence also fails or is missed, account and operational reconciliation become unreliable.

Pass condition. Stop before handoff unless the pending booking is durably confirmed. Show a retryable error; preserve idempotency and verify recovery paths.

Source: src/app/api/payu/initiate/route.ts:122-141; src/lib/firebase/serverTrips.ts:46-49; safer custom route: src/app/api/payu/custom/route.ts:36-47

L04 / P1

App Check is not provisioned or enforced

Evidence. REMOTE CONFIG: Firestore App Check is UNENFORCED; Enterprise provider has no site key. The local release check also reports the missing public Enterprise key.

Reproduce. Read the App Check service/provider configuration and run npm run check:release. No abuse traffic or public-form writes are needed.

Why it matters. Constrained public Firestore form writes are reachable without a valid app attestation, increasing spam, quota and cost exposure. No actual abuse incident was tested.

Pass condition. Deploy the working client provider, prove legitimate requests, then enable Firestore enforcement. Add appropriate source limits, quotas and alert ownership.

Source: src/lib/firebase/client.ts:27-35; firestore.rules:56,110,159; scripts/lib/release-config.mjs:10

Upload and commercial readiness

L05 / P1**Quote PDF workflow lacks private storage setup**

Evidence. LOCAL CONFIG: CLOUDFLARE_R2_QUOTE_BUCKET_NAME is missing. The source refuses quote upload setup without a separate private bucket. Remote deployment secret parity is not established.

Reproduce. Run `npm run check:release` and inspect `quoteStorage` setup. A real file upload was not performed.

Why it matters. The advertised PDF attachment workflow cannot complete in the inspected configuration. Substituting the public media bucket would violate the intended privacy boundary.

Pass condition. Provision separate private R2 storage and correct permissions/CORS; verify disposable upload, finalization, admin-only retrieval, expiry and scheduled deletion.

Source: `src/lib/quoteStorage.ts:52-59`; `src/app/api/quotes/route.ts:39-42`

L06 / P1**Policies, promises and live payments are unfinished**

Evidence. LIVE + CONFIG: policies show Draft for review; business legal name/address/support email are blank. `check:live` fails; PayU remains test mode. Free cancellation/instant-confirm badges appear despite variable supplier terms.

Reproduce. Open `/terms`, `/privacy` and `/refund-policy`; compare package badges with those policies; run `npm run check:live`.

Why it matters. Customers cannot rely on consistent approved commercial commitments. Accreditation/compliance claims also need business evidence; this audit did not prove them false.

Pass condition. Publish approved identity, contacts and package-specific terms; reconcile badges and confirmation language. Enable genuine live settings only after tested payment/refund operations.

Source: `src/lib/legalPolicies.ts:2-8,36`; `src/lib/payu.ts:30-39`; `src/app/packages/PackagesCatalog.tsx:375-378`; `src/app/packages/[packageId]/BookingCard.tsx:238`

Public content and confirmation

L07 / P1

Public catalogue contains a test product

Evidence. LIVE + HTTP: an email-like test title, gibberish copy and INR 19,999 product appears with a booking CTA. The derived `/destinations/dsvf` page is public. Report redacts the title/slug containing that address.

Reproduce. Inspect the public catalogue and `/destinations/dsvf`. A `noindex` tag does not hide content from customers.

Why it matters. Test content undermines credibility and may enter enquiry/booking flows. The unmatched product also exposes the separate checkout-catalogue defect L01.

Pass condition. Unpublish/remove the test entry via CRM; verify catalogue, derived destination, checkout lookup and caches. Editorially approve all remaining published products.

Source: Current public Firestore packages collection; `/packages`; `/destinations/dsvf`; `route-matrix.json` redacted entry

L08 / P2

Success page promises an unimplemented email

Evidence. SOURCE: the package receipt says confirmation is on its way to the supplied email. The PayU callback still has a TODO to email traveller and operations when a provider exists.

Reproduce. Read successful receipt copy and callback implementation. No email was sent as part of the audit.

Why it matters. Customers expect a confirmation the application does not send; operations needs a dependable way to notice bookings. Sandbox outcomes should remain explicit.

Pass condition. Implement notification delivery/retry/monitoring or provide accurate copy backed by a demonstrated manual confirmation workflow. Verify traveller and ops receipt.

Source: `src/app/checkout/status/page.tsx:63-64`; `src/app/api/payu/callback/route.ts:93`

Draft privacy observation: public Firestore package/blog rules allow direct reads of drafts. Decide whether drafts are public previews or private editorial data, and implement rules/collections accordingly. This is separate from the private customer collections that correctly denied anonymous reads.

Search and form consistency

L09 / P2

Search drops dates and traveller count

Evidence. BROWSER: homepage party 4 reached the catalogue URL but package detail reset to 2. SOURCE: date parameters also fail to persist; date loss was not conclusively browser-reproduced.

Reproduce. Select dates and 4 travellers on the homepage, search, then open a package.

Why it matters. Visitors repeat information and may assume dates filter availability when they do not.

Pass condition. Preserve chosen trip context into detail/quote/checkout; clearly state date availability behavior.

Source: src/app/home/_components/HeroSearch.tsx:227; src/app/packages/PackagesCatalog.tsx:397,455; src/app/packages/[packageId]/PackageDetailClient.tsx:49-53

L10 / P2

Under INR 15,000 excludes cheaper trips

Evidence. DATA + SOURCE: this band starts at INR 5,000. Seven current products below that amount meet the displayed label but are excluded.

Reproduce. Choose Under INR 15,000; inspect budgetMin=5000 and missing inexpensive treks.

Why it matters. The filter hides valid results and can reduce discovery of entry-level offers.

Pass condition. Use a lower bound matching the label; verify all qualifying cheap products appear.

Source: src/app/home/_components/HeroSearch.tsx:50; src/app/packages/PackagesCatalog.tsx:669; catalogue-price-audit.json

L11 / P2

Form constraints and dates are inconsistent

Evidence. ISOLATED: actual validators accept 1/121-character names and reversed/past flight/hotel dates. Database name rules require 2-120 characters.

Reproduce. Execute validators with those values in isolation. No live form was submitted.

Why it matters. Locally valid forms can fail at persistence or reach operators with unusable trip dates.

Pass condition. Share limits with backend rules; enforce suitable date order and past-date checks; show actionable field errors.

Source: src/app/contact/EnquiryForm.tsx:43; src/app/add-on/AddOnForm.tsx:59; firestore.rules:70; form-validation-probes.json

Controls and account return

L12 / P2**Editorial Kerala controls do not act**

Evidence. LIVE: Kerala Request a callback caused no navigation/dialog; Save showed no state/label change. SOURCE: those and related-card Save have no handler/destination.

Reproduce. Open /packages/kerala-backwaters-hills-escape and activate each action.

Why it matters. Visible promises to save or request contact can fail silently.

Pass condition. Connect each control to the working save/contact flow or remove it.

Source: src/app/packages/kerala-backwaters-hills-escape/page.tsx:227,371,390

L13 / P2**Signed-out account loses its return destination**

Evidence. BROWSER: /account redirects to plain /login. Admin login correctly retains next=/admin/content.

Reproduce. While signed out, visit /account; inspect the login URL. Real sign-in was not attempted.

Why it matters. After login, default routing can send the user to home instead of the intended account journey.

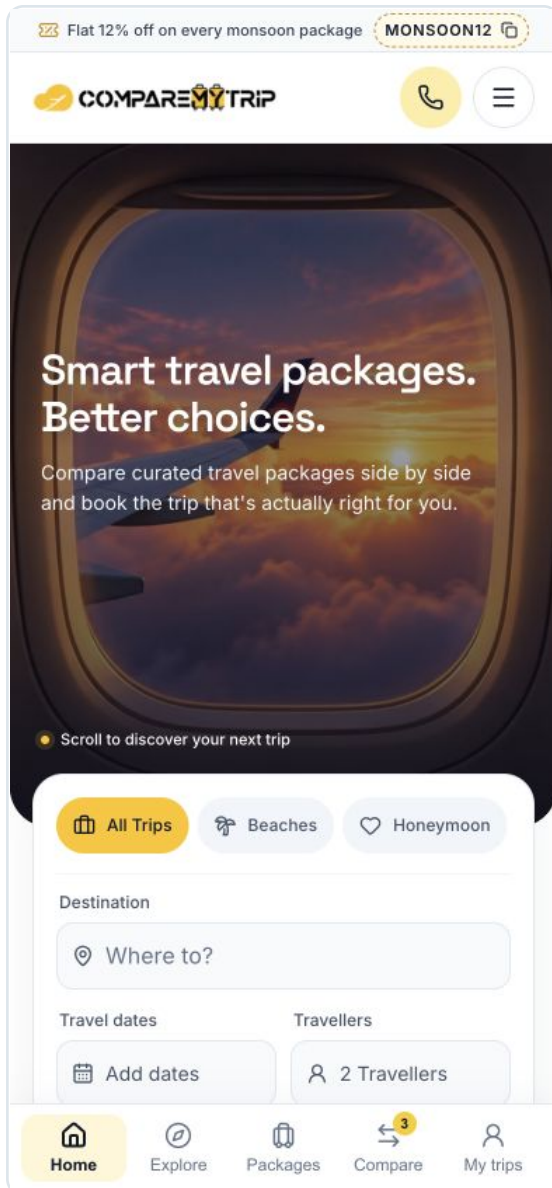

Pass condition. Preserve a validated account destination through login/signup/reset and prove the post-login return.

Source: src/app/account/AccountClient.tsx:137; src/lib/firebase/authDestination.ts; auth-ui.md

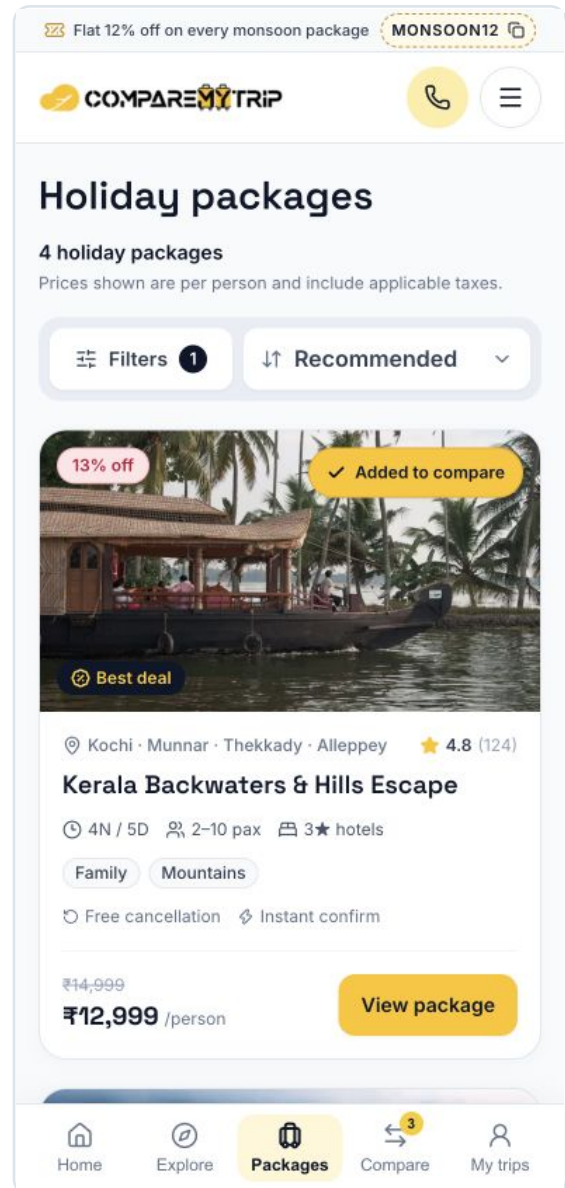

Mobile evidence: selected 390px home and catalogue interactions rendered without a horizontal overflow reported in the browser audit. These screenshots document viewport behavior, not physical-device certification.

Selected mobile views

390px browser viewport. Personal details excluded from report captures.

Homepage / search controls

Filtered catalogue / comparison

Performance and accessibility limits

Large uncompressed HTML was observed (home approximately 876 KB; packages approximately 694 KB). These figures are decompressed document sizes, not compressed transfer cost or measured Core Web Vitals.

No controlled mobile LCP/INP/CLS or load-capacity benchmark was completed. Physical Safari/iOS and Android, screen readers, contrast and a full accessibility audit remain untested. The all-200 image checks establish response availability only.

Observed UX friction: the trip-planning popup reappeared after full navigation and intercepted controls until dismissed. This was not classified as a broken underlying control.

What must pass before launch

Close each P1 finding and complete the critical real-service acceptance gates in the intended deployed build.

Gate / owner	Required evidence
1. Catalogue integrity Engineering + travel operations	Every published product agrees across display, checkout and signing. Verify edited price, new/unpublished product, traveller count, coupons and departure eligibility.
2. Payment recovery Engineering + payments	Sandbox success/failure/cancel/pending, tampered/replayed callback, retry/duplicate protection, amount mismatch and storage-outage behavior pass; receipt/account/CRM agrees with gateway.
3. Commercial readiness Business owner + payments	Approved business contacts and terms published; package promises reconciled; check:live passes with real configuration. Controlled authorized live payment/refund reconciled.
4. App Check + private files Engineering + service owner	Working attestation deployed then enforced; genuine form writes pass. Private-bucket/CORS/permissions and upload/download/expiry/deletion demonstrated.
5. Customer journeys QA + operations	Real auth consent, signup/profile, password-reset delivery, account return, enquiry/newsletter/popup persistence and date/party continuity work. Test records segregated/removed.
6. Operations Engineering + operations	Booking notification delivery or manual workflow proved; authorized cron logs, quota/abuse monitoring, alert owner, backup/recovery and rollback owner established.
7. Content + mobile Content owner + QA	Test product/destination removed; all public copy reviewed. Key mobile/physical-device interactions and realistic performance measured; blocking defects resolved.
8. Exact release Engineering	Reviewed revision and correct build/runtime settings deployed. Build/test/lint/assets/auth/release checks plus production route/action retest pass on the actual release.

Completion evidence should identify the deployment/revision, date, account role, expected result and observed result. A screenshot of a success page alone is insufficient evidence of a reconciled payment.

Outstanding verification

These are deliberate audit limits, not passed checks.

Not completed	Why evidence is still needed
Real payment, cancellation, refund and callback recovery	Mocked tests and unsigned GETs do not prove merchant credentials, gateway settlement, bank posting or refund operations.
Real signup/login/Google consent/reset delivery	Anonymous validation and provider configuration do not prove final consent, real-user profile completion or email delivery.
Customer form persistence and CRM CRUD	Page visits and input validation do not prove durable records, all role permissions or update/delete correctness.
Private PDF upload, download, expiry, cleanup	Missing local storage setup and no disposable upload leave bucket privacy, CORS and scheduled deletion unverified.
Production job execution, alerts and rollback	Committed cron schedules do not prove authenticated runtime execution, delivery monitoring or a tested recovery procedure.
Physical devices, accessibility, load and Web Vitals	Selected browser-width checks do not establish physical Safari/Android, assistive technology, capacity or production performance.

Recommended completion order

First: correct pricing, persisted receipts and fail-closed booking creation. Finalize business commitments and remove public test content.

Then: provision App Check/private storage and resolve the six customer-flow issues. Exercise real service workflows in the appropriate test environment, with disposable data and recorded results.

Finally: deploy the reviewed revision, prove controlled live payment/refund and operational monitoring, and retest the exact release. Public accessibility remains the user-authorized current state; this audit does not certify production transaction readiness.

Evidence references

Evidence: security.md, source-flow-findings.md, build-tests.md, auth-ui.md, browser-final-notes.md and route-summary/matrix/findings JSON. Source references are repository-relative. Raw diagnostic evidence includes a public test-record address; this PDF redacts it. Audit server was stopped; user tab/viewport restored; audit-added comparison removed. Existing development server was left untouched.

API inventory and safe responses

17 route templates, checked by unauthenticated GET on both origins. Mutating workflows were not completed.

Route	Implemented methods	Live GET	Local GET
/api/account/payment-reports	GET	401	401
/api/account/payments/audit-unauthenticated-probe	POST	405	405
/api/admin/payment-reports	GET, POST	404	404
/api/coupons/validate	POST	405	405
/api/cron/pending-payments	GET	401	401
/api/cron/quote-cleanup	GET	401	401
/api/integrations/google-business	GET, PUT, DELETE	404	404
/api/integrations/google-business/callback	GET	303	303
/api/integrations/google-business/oauth	POST	405	405
/api/integrations/google-business/sync	POST	405	405
/api/payu/callback	POST, GET	303	303
/api/payu/custom	POST	405	405
/api/payu/custom/callback	POST, GET	303	303
/api/payu/initiate	POST	405	405
/api/quotes	POST	405	405
/api/quotes/audit-unauthenticated-probe	POST, GET	404	404
/api/uploads/image	POST, DELETE	405	405

401 = authentication required; 404 = concealed or absent resource; 405 = GET unsupported; 303 = safe callback error/return redirect. A 405 does not mean the implemented POST is broken. These checks deliberately did not execute a successful mutation.

Additional smoke tests exercised deliberately unauthorized writes and security headers. No charge, email, CRM record or uploaded file resulted from these probes.

Complete URL matrix

Live: comparemytrip.in | Local: localhost:3100 | 199 URLs total | Part 1

Status is the initial HTTP response. Rows include query variants, redirects and negative probes; they are not 199 distinct page designs. Public test-record identifiers are redacted.
